Gokhan Sigircik

Full Stack Software Developer | Building Data-Driven AI Web Applications

Austin, Texas Metropolitan Area

Summary

Full Stack and Frontend Software Developer focused on building modern, business-driven web applications for companies, foundations, startups, service businesses, real estate workflows, financial-analysis tools, registration systems, internal operations platforms, client-facing portals, and SaaS-style products. I specialize in turning business requirements into clean, scalable, production-minded software. My work connects frontend architecture, backend engineering, database design, API development, authentication flows, user dashboards, admin panels, structured data workflows, and automation-focused product logic. My technical stack includes JavaScript, TypeScript, React, Next.js, Node.js, Express, Python, Django, FastAPI, Flask, Java, Spring Boot, PostgreSQL, MySQL, MongoDB, REST APIs, Git/GitHub, Postman, AWS, Figma, and modern full-stack development practices. I bring a rare combination of software engineering execution, frontend product sense, business operations understanding, and manager-level ownership. I do not simply write code. I analyze workflows, identify inefficiencies, design better systems, structure the data, build the interface, connect the backend, test the product, and improve the experience until it becomes usable, professional, and valuable. I have worked across multiple project types including registration platforms, financial and property-analysis tools, nonprofit/foundation digital platforms, business workflow systems, data-driven dashboards, form-heavy applications, and full-stack web products that require both technical precision and practical business thinking. My strength is end-to-end ownership: understanding the problem, planning the architecture, building frontend experiences, developing backend services, modeling databases, integrating APIs, debugging complex issues, improving usability, and delivering software that supports real operational goals. I am positioned for software engineering, full stack development, frontend engineering, and product-focused development roles where companies need someone who can combine technical execution with business judgment,

communication, accountability, and the ability to move projects from idea to working product.

Experience

Fundação Casa de Mateus

Lead Full Stack Developer

January 2023 - Present (3 years 6 months)

Vila Real, Portugal

- Leading full-stack development for the Mateus Palace Foundation digital platform, using React, Next.js, Python, FastAPI, and PostgreSQL to transform foundation-related workflows into a scalable, modern, web-based product.
- Owning the full end-to-end engineering execution across frontend architecture, backend API design, machine learning, data modeling, reusable component development, form workflows, testing, debugging, and product iteration.
- Architecting a 3-layer full-stack application structure across user interface, server-side logic, and database operations, creating a cleaner foundation for long-term scalability, maintainability, and future feature expansion.
- Building reusable React components, API-connected pages, backend routes, and database-driven flows to improve consistency, reduce duplicated development effort, and deliver a more professional user experience.
- Translating business, nonprofit, and cultural organization needs into practical software features, connecting product thinking with technical execution, user experience, and operational value.
- Supporting the foundation's digital transformation by improving online accessibility, structured information flow, stakeholder-facing usability, and the platform's readiness for future growth.
- Delivering ongoing full-time engineering ownership in a remote environment, balancing independent execution, product judgment, clean code structure, communication, and professional accountability.

Upwork

Software Developer

June 2022 - August 2024 (2 years 3 months)

Washington, DC

- Delivered full-stack software solutions for various companies, owning multiple web application builds from concept to working product across frontend, backend, database, API integration, testing, debugging, and deployment-ready execution.

- Led development of the C.A.M.P.S. registration platform using React, Java Spring Boot, and MySQL, transforming a manual registration workflow into a structured, database-driven application with cleaner data entry, record management, and user flow.
- Built scalable full-stack application architecture across React-based interfaces, REST-style backend services, relational and non-relational databases, reusable components, form-heavy workflows, and business logic designed for real operational use.
- Managed end-to-end engineering ownership across requirements interpretation, technical planning, UI implementation, backend development, database modeling, API testing, bug resolution, and product iteration.
- Developed multiple software projects focused on business workflows, structured data handling, user-facing dashboards, registration systems, financial-style calculations, and process automation without relying on generic template work.
- Strengthened product quality by improving application flow, reducing manual process complexity, organizing data into cleaner systems, and creating software that turns business requirements into practical, usable digital tools.
- Operated with strong ownership, communication, execution discipline, and professional accountability, delivering developer-level results across multiple project scopes and technologies.

Cashflows

Full Stack Developer

August 2022 - November 2023 (1 year 4 months)

Remote

- Developed Cashflows as an end-to-end property investment analytics platform using Python, Flask, Jinja2, and MySQL, transforming manual buy-rent analysis into a structured, data-driven web application.
- Architected the full application workflow across property input, rental-income modeling, expense tracking, cash-flow calculation, and investment decision support, creating a faster and more professional analysis process.
- Built backend logic and database-connected features to calculate profitability scenarios, organize property financial data, and support clearer investment decisions for real estate use cases.
- Improved the user journey from raw financial assumptions to actionable insights by designing cleaner forms, structured data flows, reusable templates, and decision-oriented outputs.

- Delivered 100% full-stack ownership across backend development, database design, frontend templates, form handling, testing, debugging, and iterative product improvement.
- Positioned the application around real business value: reducing spreadsheet-style complexity, improving analysis consistency, and helping users evaluate property opportunities with stronger financial visibility.

Four Seasons

Operations Manager

September 2013 - August 2022 (9 years)

Jackson, Wyoming, United States

- Supervised teams of +100 associates while supporting a high-volume operation connected to a multi million dollar revenue environment.
- Partnered cross-functionally with engineering/IT, sales, marketing, payroll, and operations teams to keep the department aligned, resourced, and accountable.
- Led daily restaurant operations inside a luxury resort environment with high expectations for precision, communication, and guest experience.
- Prepared operational and performance reports for department leadership, supporting decisions across staffing, service quality, and execution.
- Improved guest experience outcomes by actively managing floor execution, team communication, service recovery, and performance standards.
- Built leadership habits that now directly support software work: calm under pressure, structured problem-solving, documentation, team communication, and ownership.

Education

Coding Dojo

Full-Stack Software Engineering, Computer Software
Engineering · (September 2022 - June 2023)

Instituto Politécnico de Bragança

Master of Computer Applications, Computer Programming, Specific
Applications · (September 2012 - June 2013)

Sakarya University

Bachelor's degree, Industrial Engineering · (September 2008 - June 2012)
